

# TRANSIT TRACK INSPECTION

With the largest fleet of track inspection vehicles in North America, Holland offers solutions to provide valuable information about the safety of your rail for maintenance and planning.

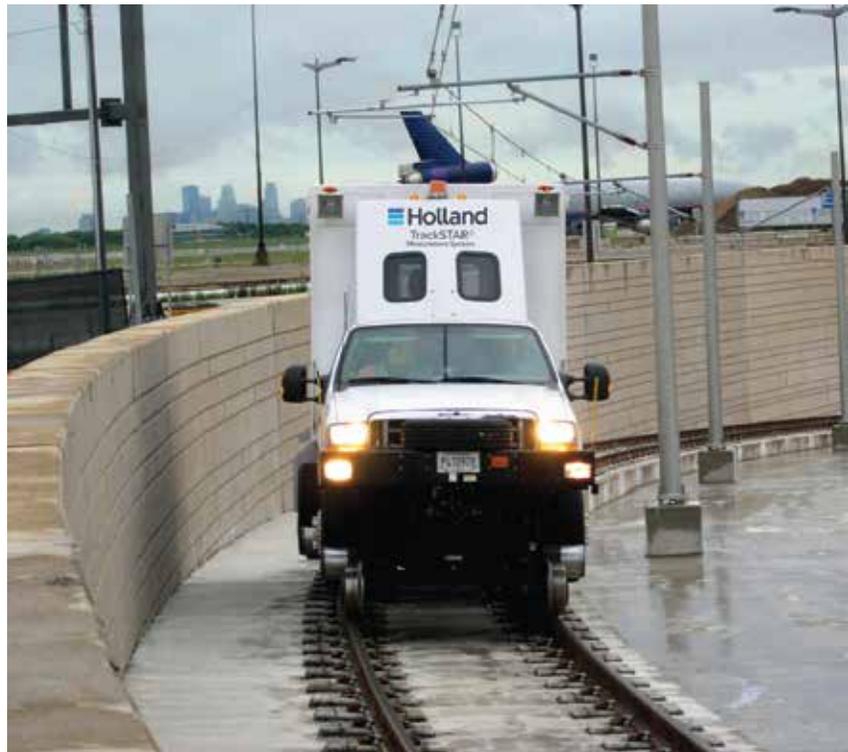

Holland's TrackSTAR® testing vehicles can simultaneously collect track geometry, track strength, and rail profile measurement data to provide a comprehensive assessment of your track condition.

Holland's Transit Testing hi-rail vehicle (TTV) is designed specifically to accommodate the unique conditions of transit systems, including broad gauge, tight clearances, and tight-radius curves (up to 70 degrees). TrackSTAR 491 also incorporates a mini load axle to identify areas with poor tie/ fastener conditions. Partnered with Holland's Rangecam Reporting Software, the TTV 491 provides a comprehensive testing and reporting package.

## Our track inspection and maintenance services, including:

- Baseline and routine track inspection
- Track geometry measurement
- Rail profile measurement
- Track gauge strength
- Scheduled testing programs
